Wheels  Diameter / Distance Traveled

**Radius** is the measurement of a straight line from the center of a circle to the edge. Radius will always equal one half diameter.

**Diameter** is the measurement of a straight line across the center of an object (in this case a wheel).

The **circumference** of a circle is the total distance around its outside. Circumference equals the diameter of the circle times \( \pi \) (pi), which is about 3.14. One revolution of a wheel will make it move a distance equal to its circumference.

---

**Instructions**

Based on the information provided about the wheels shown on these pages, calculate how far they will travel. An example is shown below. Complete the information on the following pages.

**Example**

If the wheel below makes one revolution, how far will it go? Use the tables below to find the answer.

\[
\begin{array}{ccc}
\text{Diameter} & \times & \pi \text{ (pi)} \\
1.125" & \times & 3.14 \\
\hline
\text{Circumference} \\
3.53" \\
\end{array}
\]

\[
\begin{array}{ccc}
\text{Circumference} & \times & \text{Revolutions} \\
3.53" & \times & 1 \\
\hline
\text{Distance} \\
3.53" \\
\end{array}
\]
Instructions
Based on the information provided about the wheels shown on these pages, calculate how far they will travel.

If the wheel below completes 2.3 revolutions, how far will it go? Use the tables below to find the answer.

If the wheel below completes 3 3/8 revolutions, how far will it go? Use the tables below to find the answer.

If the wheel below completes 4 5/16 revolutions, how far will it go? Use the tables below to find the answer.
Wheels Diameter / Distance Traveled

Questions:

1. If you want your robot to go 15.748 centimeters and your robot has wheels with diameters of 2.5", how many revolutions must your wheel make?

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

2. If there were a wheel that had a circumference of 12.36375 cm, what would the diameter be?

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

3. If I wanted my robot to win a 2 meter race, what wheels would I use and how many revolutions would it have to make?

(Hint: To win the race, you should try to go the fewest number of revolutions. You may have to go over 2 meters.)
